

LusterGlaze Paint Protection

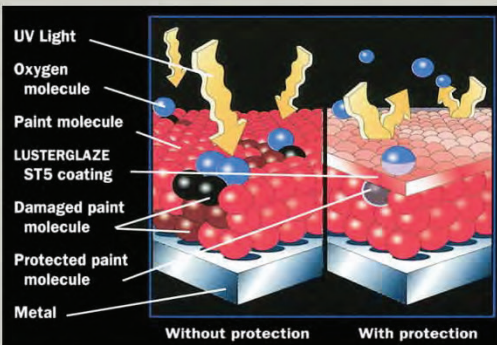

Why Protect?

Exterior painted surfaces are subjected to many harmful conditions over the life of a vehicle. UV radiation can cause deterioration of painted surfaces. In addition, in everyday use, most vehicles are exposed to a variety of potentially harmful contaminants such as tree sap, bird droppings, road salt and grime.

LusterGlaze Corporation is a chemical manufacturer specializing in the production of restoration and protection chemicals for the automotive industry.

LusterGlaze products offer superior performance and quality due to:

- Specialized expertise developed through extensive experience in automotive protection and reconditioning applications
- State-of-the-art products derived through solid technical knowledge and research
- Thorough product testing for both short and long term performance

The coating contains materials which both absorb harmful UV rays, while at the same time increase the reflectiveness of the paint surface, resulting in a brighter look. The slick, non-stick nature of the coating also makes dirt and grime less likely to adhere to the paint surface, making it easier to clean.

Interior Cavity Rust Protection

Why Protect?

Interior metal surfaces are vulnerable to the most damaging rust problems. Less protected than exterior surfaces with multi-layer paint and primer, "inside-out" rust can corrode metal panels, completely destroying the underlying metal before it is noticeable on the outside.

▲ Without protection

The LusterGlaze Solution

LusterGlaze Rust Inhibitor is a highly effective rust preventative coating applied to interior metal surfaces such as fenders, door panels, trunk and hood cavities to prevent corrosion from starting and spreading to a destructive stage.

Underbody Panel Protection

Why Protect?

Underbody metal panels are the surfaces most exposed to corrosive elements such as water and road salt, as well as abrasive elements such as sand and road stones.

The LusterGlaze Solution

LusterGlaze Undercoating is a soft, flexible coating which contains rust inhibiting material for corrosion prevention. At the same time, underbody coating provides a "cushioning" effect to reduce road noise – an additional benefit you experience from the first day you drive your vehicle to the last.

Why Protect?

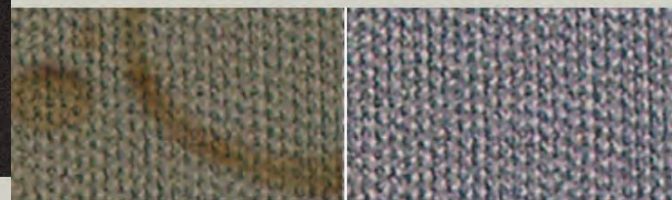

In everyday use, vehicle seats and carpets are exposed to spills of food, beverages, or various household chemicals. If these materials soak into the fabric, the resulting stains can be very difficult to remove. Dirt and grime can also penetrate and adhere to the fibres, making cleaning difficult.

The LusterGlaze Solution

LusterGlaze Fabric Protector forms an inert, non-stick coating around fabric fibres. The coating is flexible, durable, and effectively repels most common stains, preventing penetration into the fibres.

Also, because the LusterGlaze coating is non-stick, it has an exceptionally low tendency to attract dirt, so cleaning is much easier.

Why Protect?

Vinyl and leather materials contain substances which make them soft and flexible. Over time, some of these substances are lost due to evaporation, cleaning or wear. When this happens, the vinyl and leather surfaces can become dull, more brittle and prone to creasing and cracking.

The LusterGlaze Solution

LusterGlaze Vinyl/Leather Protector seals and supplements the natural oils in leather and the additives in vinyl used to soften the material.
